

Cherrington Models 3000 and 5000
Used for the harvesting of sludge in retention ponds.

Using a small hole sized screen, the crust of the sediment can be loaded while the fines are returned to the bed.

Precise hydraulic adjustments on the screens depth, allows the operator to skim the surface and load the sludge into the hopper box. Both models have a high lift dump for loading into trucks or trailers. Loading flight speed control along with screen oscillation speed allows for fast operation in almost all conditions.
